

CI 2000 A Vines

First name: Aaron

Last name: Vines

Q1:

Q2:

To make uniform the classification categories across all relevant media across all states and territories.

Q3:

Yes. Classifying all content available on the internet should not be the focus of classification, the reason being that simply finding all content online would be next to impossible. My fear would be that if content online was yet to be classified, would it be viewable, or possibly blocked from viewing via internet filtering.

Q4:

This is a reasonable suggestion, enabling targeted classification of websites and games on internationally available platforms.

Q5:

Q6:

Yes

Q7:

No. Never.

Q8:

Yes. Advisory classifications should be used on music, but restrictions on music should only be made in the event that music is overwhelmingly hate-filled.

Q9:

No

Q10:

No

Q11:

Q12:

There is no effective method of controlling access to online content, ever.

Q13:

Education.

Q14:

The current system appears to be working, though I have little experience with this.

Q15:

Whenever a product has been classified as such. These stickers/labels help to educate the consumer as to the nature of the product being purchased. Anything less would be irresponsible.

Q16:

Government should have oversight, industry should regulate, users should be able to lodge formal complaints, which would alert the government body to investigate the validity of the complaint. The

industry would then work with the government on a case by case basis to reach agreement on the correct classification.

Q17:

I believe that such a system would be practical and achievable. Such a system allows those who have familiarity with the products and their intended audience to classify a product easily. The industry should be subject to transparency in all cases.

Q18:

Film, tv, music and games all appear to be easily self-regulated.

Q19:

Q20:

The existing classification categories are good. Confusion comes when different platforms of media attract different classification categories. All media that needs to be classified should be classified using the same universal classification system.

Q21:

The current categories, ending with an X category is good. Applying this as a universal system is appropriate, across all states and territories.

Q22:

The use of a universal system does this well.

Q23:

Yes. Emphatically, yes.

Q24:

I do not believe a filter achieves anything.

Q25:

Q26:

Yes. I don't believe any promotion is required.

Q27:

Q28:

Yes, for the purpose of a national classification network.

Q29:

The inclusion of ALL categories across all states across all relevant forms of media.
